The skies are filled with eyes. Imagine high-definition, forty-two-megapixel cameras with rotors that spin at thirteen thousand RPM (rotation per minute) monitoring us in our own homes. As of today, there are more than eight hundred thousand drones that are registered in the United States by the FAA. The number of drones is increasing so exponentially that personal privacy seems to be disappearing as the drones in the skies are appearing. An ethics and philosophy teacher at Worcester polytechnic institute, John Sanbonmatsu argues in his article “The drone Invasion” that drones affect our privacy, the natural world, and our connection to it. He masterfully uses Aristotle’s appeal to portray his argument to the readers. While he draws a majority of his rhetorical appeals from pathos, his background as a philosophy and ethics teacher brings creditability to himself. In addition, the use of facts and logic used to discuss the morality and ethics of drones deftly ties all of the methods of Aristotle’s appeal together.

In “The drone invasion,” Sanbonmatsu asks, “What then would it mean for us to gaze upwards and to see, interposed between us and the clouds, an endless, airborne stream of cheap commodities?” This question strikes the emotional appeal by asking the reader what it would feel like to have the connection between humans and the spiritual realm severed. Questioning the reader, and asking them to feel for the author’s argument is one of the ways Sanbonmatsu uses pathos to portray his message. Pathos is a rhetorical technique that evokes an emotional response from the readers. Sanbonmatsu successfully calls out to the readers’ emotions when he explains, for countless generations, the connections that humans have to the spiritual world have been connected through the sky and it has been the horizon of human myths and imaginations. For countless centuries, it is believed that after one passes away they go to “heaven,” this heaven is

believed to be up in the sky by millions of people, yet nobody has seen it to this day. This common belief that humans share among one another brings sentiment and connects the readers' hearts making them want to fix this soon-to-be world with "cheap commodities" in the sky that is interfering with humans connected to the spiritual world.

Though a significant portion of this article contains an emotional appeal, Sambonmatsu does an exceptional job of having logical reasoning and an ethical appeal to have a well-rounded and balanced argument. The use of pathos was applied to serve the argument to the readers' hearts, but by adding the use of ethos and logos the reader is more likely to consume and digest the author's argument. In this article, the uses of emotional appeal are utilized in perfect proportions, so there is room left on the plate for ethos and logos. His claim is swiftly followed by logical reasoning when he implies that workers are going to be replaced with the creation of drones and robots. Using logical reasoning the reader can conclude that the labor cost for humans is exponentially higher compared to drones and robots because they are merely machines that are programmed to function in a human-like manner to complete tasks. Companies pay thousands in compensation for the hard and intensive labor that humans put in, but robots won't need to get paid. In addition, companies are willing to go the extra mile to create drones and robots that will replace humans and save them thousands. Sambonmatsu's background as an ethics and philosophy teacher raises his credibility, therefore, raising the value of his words.

This article is addressed to the general public, where everyone's views are unique. While one may be in favor of drones because they are a fun gadget to fly, others may be shaking in fear of their privacy being compromised. Ultimately, some might not even know what drones are. As he is explaining what having drones flying in the sky is like, he uses logical reasoning to back his argument. He explains how biologists are unsure of the impact of having thousands of drones in

the sky, but the available evidence suggests that drones in the sky would frighten, confuse or anger many animals, as we are intruding into their living space. This is logical reasoning which is one of the three pillars that are needed to make a well-rounded argument.

When the subject of drones is brought up, the immediate thoughts that rush to the readers' minds are privacy, vulnerability, and ethics. Sanbonmatsu emphasizes this when he states "imagine the NSA harnessing the power of drones equipped with high-definition cameras and sophisticated communications equipment, monitoring us in our backyards, or even our homes." This statement forces the reader to imagine a world where they would be monitored in their very own safe place. By letting the reader imagine and decide whether having these drones in the sky is ethical or not. The author avoids putting his own opinion into the argument and ultimately makes it invalid. This statement also emphasizes how intrusive and unethical drones can be even when they are in the hands of trusted officials such as the National security Agency which is responsible for the safety of the United States. Sanbonmatsu, being an ethics and philosophy teacher also creates this sense of trust that the reader can have in him due to his well-educated background in ethics.

February 4, 2016, was when Sanbonmatsu's article about the drone invasion was published. When this article was published there was a real fear of the rapid growth in technology. It felt as if these inventions were going to take over the world in the near decade. Six years later, the invasion of drones has yet to take place. Sanbonmatsu was not alone in this fear of robots taking over the world, many other Americans were also wary of losing their jobs to robots and having high-quality cameras with wings flying around monitoring them in their homes. Sanbonmatsu presents his argument in a well-rounded manner where there is a balance between the uses of all three of Aristotle's appeals. With pathos, he uses the beliefs shared by

humans to bring forth his argument in a heartfelt manner. Uses logos to give logical reasoning to the argument. Uses ethos to show how unethical and intrusive these drones can be even while being in the hands of our protectors. Sanbonmatsu uses all three methods of Aristotle's appeals so seamlessly that his whole argument feels firm and unbreakable. The drone invasion has yet to take place and it could all be thanks to the article written by John Sanbonmatsu on the drone invasion.
